

## Test documents

Equipment: Deploying three nodes to build a private chain.

A. Regular node of ethereum: ssh [root@\\*.\\*\\*\\*.\\*\\*\\*.\\*\\*\\*](#)

```
geth --datadir /root/testprivate console
miner.start()
```

B. Regular node of Usechain: ssh [root@\\*.\\*\\*\\*.\\*\\*\\*.\\*\\*\\*](#)

```
geth --datadir testpriv/ --bootnodes
enode://83a142fe4dc4eafbc0c70679c1a04bc5a3c69e6131d7a72b2853d4aea570999ca399cb086f
56b673cb5b007d77bf8a7b1ab2cb3b67ddabf440c94bb03d399fc@[*.***.***.***]:30303
--rpc --rpcaddr 0.0.0.0 --rpcport 8545 --rpcapi 'web3,eth,personal' --rpccorsdomain * 0
geth --datadir ~/testpriv/ --rpc --rpcaddr 0.0.0.0 --rpcport 8545 --rpcapi web3,eth,personal --
rpccorsdomain * console
```

C. Regular node of Usechain: ssh [root@\\*.\\*\\*\\*.\\*\\*\\*.\\*\\*\\*](#)

```
geth --datadir testpriv/ --bootnodes
enode://83a142fe4dc4eafbc0c70679c1a04bc5a3c69e6131d7a72b2853d4aea570999ca399cb086f
56b673cb5b007d77bf8a7b1ab2cb3b67ddabf440c94bb03d399fc@[*.***.***.***]:30303
```

Ensure that the three nodes are connected to the same network, and the blocks are synchronized.

### Step 1:

Machine A: account[0]: 0xe984996f42d9348999b4dcb8b897597fc3725b10

Create CA contract (USG contract, publicAccount contract not yet deployed):

```
eth.sendTransaction({from: eth.accounts[0], value: 0, gas:'0x332423', data:
'0x6060604052600060045534156200001557600080fd5b60405162001b5738038062001b5783398

Since `sendAuthentication` is a subsequent command, `sendTransaction` is used to authenticate transactions.

When the transaction is broadcast to B, the C node will be identified with errors (the following is

the Tcert address and the sending address do not match).

```
6. root@iZwz9gklpnejn2tmfc4b15Z: ~ (ssh)

```

After that, A continues to block, and B, C nodes no longer synchronize A broadcast blocks (because there are illegal blocks on the chain of A).

Step 7. (machine A)

Clear the blocks on the A chain, restart the geth, the A machine synchronize the blocks from the BC machine, and synchronize to the same block height.

The machine A is an unmodified Ethernet geth that can package an unlawful ordinary transaction; it needs to be tested that the illegal block sent by it will not be packaged by a normal Usechain node.

### An ordinary transaction that sends an unlawful address

Trade broadcasts to B, C nodes, will be identified

The block broadcast B, C node, will be identified.
